Chapter 1

Introduction

Erudite is a very simple system for Literate Programming in Common Lisp.

Some of its salient features are:

- Documentation is written in Common Lisp comments. This is very useful because you can work with your program as if it were not a literate program: you can load it, work from SLIME, etc, directly.
- There are no chunks weaving or special directives like in original LP systems. This is not so cool, as there's no flexible way of controlling the order of the comments and code, like in other systems. But like Haskell (and its LP support), Lisp code is also pretty easy to sort without too much problems (I think...).

Chapter 2

Invocation

Erudite is invoked calling `erudite` function.

```
(defun erudite (pathname files &rest args &key (output-type *output-type*)
                                                    (input-type *input-type*)
                                                    &allow-other-keys)
  (let ((*output-type* output-type)
        (*input-type* input-type))
    (apply #'gen-doc output-type pathname files args)))
```

Chapter 3

Implementation

First, files with literate code are parsed into *fragments*. Fragments can be of type *documentation* or type *code*. *documentation* is the text that appears in Common Lisp comments. *code* fragments are the rest.

```
)  
  
(defvar *input-type* :erudite)  
(defvar *output-type* :latex)  
(defvar *current-path* nil)  
  
(defmethod process-file-to-string ((pathname pathname))  
  (let ((*current-path* (fad:pathname-directory-pathname pathname)))  
    (with-open-file (f pathname)  
      (post-process-output  
        (with-output-to-string (s)  
          (process-fragments  
            (split-file-source f)  
            s))))))  
  
(defmethod process-file-to-string ((files cons))  
  (post-process-output  
    (with-output-to-string (s)  
      (process-fragments  
        (loop  
          :for file :in files  
          :appending (let ((*current-path* (fad:pathname-directory-pathname file)))  
                      (with-open-file (f file)  
                        (split-file-source f))))  
      s))))  
  
(defmethod process-file-to-string :before (pathname)  
  (setf *chunks* nil  
        *extracts* nil))  
  
(defmethod process-file-to-string :after (pathname)  
  (setf *chunks* nil  
        *extracts* nil))  
  
(defun process-string (string)  
  (let ((*chunks* nil)  
        (*extracts* nil))  
    (post-process-output  
      (with-input-from-string (f string)  
        (with-output-to-string (s)  
          (erudite::process-fragments  
            (erudite::split-file-source f)  
            s))))))
```

```

Code blocks in Sphinx are indented. The indent-code function takes care of that:

```

(defun indent-code (code)
  "Code in sphinx has to be indented"
  (let ((lines (split-sequence:split-sequence #\newline
                                                code)))
    (apply #'concatenate 'string
            (mapcar (lambda (line)
                      (format nil "    ~A~%" line))
                    lines))))

(defmethod write-code (code stream (output-type (eq1 :sphinx)))
  (write-string ".. code-block:: common-lisp" stream)
  (terpri stream)
  (write-string (indent-code code) stream)
  (terpri stream))

```

Chapter 4

Backends

Erudite supports LaTeX and Sphinx generation at the moment.

4.1 LaTeX

```
(defgeneric gen-doc (output-type pathname files &rest args))

(defmethod gen-doc ((output-type (eql :latex)) pathname files
                    &key title author template-pathname input-type &allow-other-keys)
  "Generates a LaTeX document.

  Args: - pathname: The pathname of the .tex file to generate.
        - files: The list of .lisp files to compile
        - title: Title of the document
        - author: Author of the document
        - template-pathname: A custom LaTeX template file. If none is specified, a default
                           template is used."
  (let ((template (cl-template:compile-template
                   (file-to-string (or template-pathname
                                       (asdf:system-relative-pathname
                                        :erudite
                                        "latex/template.tex")))))
    (with-open-file (f pathname :direction :output
                      :if-exists :supersede
                      :if-does-not-exist :create)
      (write-string
        (funcall template (list :title title
                               :author author
                               :body (process-file-to-string files)))
        f))
    t))
```

4.2 Sphinx

Sphinx is the other kind of output apart from LaTeX.

```
(defmethod gen-doc ((output-type (eql :sphinx)) pathname files &key prelude postlude input-type
                    &allow-other-keys)
  "Generates Sphinx document.

  Args: - pathname: Pathname of the .rst file to generate.
```

```

- files: .lisp files to compile.
- prelude: String (or pathname) to append before the Sphinx document.
- postlude: String (or pathname) to append after the Sphinx document."
(with-open-file (f pathname :direction :output
                  :if-exists :supersede
                  :if-does-not-exist :create)
  (when prelude
    (write-string
     (if (pathnamep prelude)
         (file-to-string prelude)
         prelude)
     f))
  (write-string (process-file-to-string files) f)
  (when postlude
    (write-string (if (pathnamep postlude)
                      (file-to-string postlude)
                      postlude)
                  f))))

```

4.3 Commands

Commands are held in `*commands*` list

```

(defvar *commands* nil)

(defun find-command (name &optional (error-p t))
  (let ((command (gethash name *commands*)))
    (when (and error-p (not command))
      (error "Invalid command: ~A" command))
